

ABSTRACT OF THE DISCLOSURE

There is disclosed a laser microscope in which
a beam splitter extracts a part of a laser light of
two wavelengths $\lambda_1 = 488$ nm and $\lambda_2 = 514.5$ nm, a prism
5 spectrally resolves the laser light of the two
wavelengths λ_1 and λ_2 , a two-split photodiode detects
intensities of two lines spectrally resolved in this
manner, and a controller controls an AOTF fixed to
an output end of an argon laser based on a detection
10 signal outputted from the two-split photodiode so
that respective light intensities of both lines of
wavelengths λ_1 and λ_2 become constant.
